Professional Summary

Full-stack engineer with seven years in banking building internal tools end-to-end — backend services, React frontends, and custom Elasticsearch search and visualization apps. Led engineering teams for the last four years, bringing order to fragmented systems by standardizing data from multiple regional markets into a single internal platform.

Experience

DBS Bank, Vice President

Singapore

Mar 2024 – Apr 2025

1 year 2 months

- Led the engineering squad building a centralized observability platform, architecting the proof-of-concept and defining core data specs for latency, availability, throughput, and error-rate tracking bank-wide
- Ran daily standups with data owners across markets and lines of business to source and standardize telemetry into a unified Logstash ingestion architecture
- Directed feature and data-schema requirements through sprint planning, guiding a direct report building the platform's web front end
- Contributed to an early front-end proof-of-concept with the team, visualizing system-to-system dependencies on a compressed timeline, while continuing to contribute code and review PRs throughout the role

DBS Bank, Assistant Vice President

Singapore

Mar 2021 – Feb 2024

3 years

- Took the lead on the Kafka/Elasticsearch pipeline and Logstash enrichment layers built during the previous role, scaling them for enterprise-wide logging and real-time alerting
- Acted as the primary point of contact for lines of business and the incident management team on requirements, design, and real-time alerting needs
- Continued personally coding and maintaining the pipeline's core systems given a lean team and firsthand knowledge of the original implementation
- Built internal web applications and custom dashboards (Grafana, Kibana, Vega) to speed up incident diagnosis across squads
- Scaled Elasticsearch infrastructure to ~24 servers handling roughly 100GB of daily events and log data, with ~4TB total storage

DBS Bank, Senior Associate / Associate

- Continued maturing the Elasticsearch monitoring work from NCS into full production clusters, building custom health-monitoring functionality for internal search and infrastructure use cases
- Designed and built the initial Kafka/Elasticsearch event streaming pipeline and Logstash enrichment layers for enterprise logging and real-time alerting, implementing custom Ruby filters for advanced event transformation
- Wrote custom shell scripts to parse and combine logs from native banking applications that couldn't be customized at the source, normalizing them before ingestion through the Filebeat → Kafka → Logstash → Elasticsearch pipeline
- Patched Grafana's server code to support additional TLS cipher suites required by DBS's security policies, which weren't available out of the box
- Identified that a Grafana version change switched null-value handling from "null as zero" to "connected" — masking outages behind stale last-known values on single-stat panels — and patched the source internally to restore accurate reporting

Singapore
May 2018 – Feb 2021
2 years 10 months

NCS Group, Application Consultant (Client: DBS Bank)

- Built early Elasticsearch (v2.0)-based monitoring and search tooling before native visualization tools had matured

Singapore
Aug 2016 – May 2018
1 year 10 months

Skills

Observability & Telemetry: Elasticsearch, Logstash, Ruby (scripting/data pipelines), Kibana, Grafana, Vega, Filebeat

Full-Stack Engineering: JavaScript, React, Node.js, Python, Java, REST APIs

Data & Messaging: Apache Kafka, SQL, NoSQL

Systems & Operations: Enterprise Linux, Bash/Shell Scripting, Git, CI/CD Pipelines, Incident Triage

Modern Tooling & AI: Claude Code, VS Code + Claude, Agentic Coding Workflows

Education

BEng **Nanyang Technological University**, Computer Science

Singapore
Aug 2013 – Jun 2016

Diploma **Temasek Polytechnic**, Electronics (Robotics) – with Merit

Singapore
Apr 2007 – Sep 2010
